## History (GUADEC 2008)

Thursday, 8:00 PM
Honey (Federico), can you help me find my homework from last Monday?

History (GUADEC 2008)
Zeitgeist Project
.Where did you put it?
.No idea, I just saved it!
.What did you call it?
.I don't remember! It's an Essay on the History of Teaching

History (GUADEC 2008) Zeitgeist Project
. Previous non-solutions:

- Look for the file by browsing through folders
- Putting everything in ~/Documents
- Using Recent Documents from the menu bar
- Using Recent Documents from the application

## What did I do?

Computers have no sufficient concept of user activities

Doesn't your computer "participate" in your activities?

## Mataphors

## Extension of "recently used"

## Journal or Diary

## Remembering

Memory for facts
-"semantic memory"

Memory for your own activities

- "episodic memory"

## Metadata / Context

.Semantic
Static information properties
.Grouping and linking
-User indicates relationships
.Episodic
-What happened?

## User-Activity Perspective

.Information gains relevance by use (= employing it in the user's activities)
-Recency

- Scoping via time
-Repetition, frequency
-Repeated use doesn't mean "doing the same thing twice"
-Within and across activities
-Intensity
-Most used
.Stuff you use together ... belongs together?

## Typical Activities

## Zeitgeist Project

- Development
- Plan
- Update code base
- Review changes
- Communicate about changes
- Coordinate tasks \& activities
- Edit code
- Find and use related information
- Test code
- Report bug
- Commit changes
- Update documentation
- Choose another task, bug

## - Writing a Report

## Typical Development Activities

## Zeitgeist Project

## Issues

.Re-find an item
.Re-find collections of use
.Resuming work

## Further lssues

- Anchoring to real-world events
- Reporting about a certain time period
- Reflaction and Planning
- Keeping track and control of
- Information Development
- Where it comes from \& where it goes to (Diffusion)

## Events

.The basic model

## Zeitgaist:

- Tracker, Beagle and Nepomuk is all about indexing and searching for files and documents

Zeitgeist is all about logging Events.

- Two types of Events:
- Activity: A user does something as in triggers and Event.
- Notification: Something happens that does not originate from the user
- Events are unique
- Events can not be replicated
- Events currently don't have a representation on the Desktop
- What would happen if we look at Events as entities of their own
- The source of events are Applications.
- With an Event an Application issues that it is "DOING"(Activity) someting or something just „HAPPENED"(Notification)
- Usually (not always) an Event occurs there is a Document involved
